

*It takes years of experience to create the perfect aquarium design*

Benefit from our involvement with some of the best reef tanks in Europe

D-D has always been at the **forefront of modern reefkeeping** and involved with some of the **best reef aquariums** in Europe. We have drawn on over 120 years of combined knowledge and experience in reefkeeping and aquarium production to develop and build what we believe is the **perfect affordable systemised reef aquarium**.

Silence is golden.

A key requirement for any good modern aquarium, is for it to run as close to silently as possible.

By installing our proven twin pipe overflow system we eliminate almost all water noise whilst incorporating a safety bypass to remove the risk of flooding.

**Create Your Perfect System!**

Suitable for keeping SPS Corals, LPS Corals, Soft Corals and for Fish Only.

## Aquarium

**1. Crystal clear, braceless aquarium** with **fully polished edges** to provide an unimpeded view of your own personal reef.

**Balanced width** to height ratio to **enhance viewing**, aquascaping and ease of coral placement.

**2. Unique "Invisible weir box"** design which **disappears** into the back of the aquarium.

**3. Multi-stage weir design** provides a **high turnover rate** in the tank whilst minimising drain down levels in a power loss situation.

Special **"Ultra-Flow"** weir comb allows 30-50% more water through, so that larger pumps can be used.

**4. Twin overflow pipes** with adjustable valve offers **safe and whisper quiet** operation.

**5. "Dry Box "** built into weir section to hide and pass through any pump and lighting cables.

**6. Perfectly matched** for use with the D-D Slimline lighting bracket and **Aquallumination lighting**.

## Cabinet

**7. Sleek, extra tall cabinet** that offers the perfect viewing height for the aquarium whilst providing extra internal space for installation of any equipment.

Cabinet supplied **pre-assembled as standard** with lacquer coated, **fully adjustable**, soft close hinges.

**Modern, heavy duty cabinet** using 36mm board, with high quality finish to compliment the home environment & adjustable feet **(8)** to allow **correct levelling** of the aquarium on uneven floors.

**Good ventilation** is incorporated into the chiller and sump areas and **removable, quick release, folding or bi-folding doors** offer improved access for maintenance.

**Separate chiller section** with storage shelf is included on the larger models.

As hobbyists, with each new aquarium that we own we learn how to identify and improve small details in the design and incorporate these ideas into our next "perfect system".

With the **D-D Reef-Pro Aquarium** we have taken decades of continuous improvements and incorporated them into our own version of the **"perfect systemised aquarium"**, affordable and suitable for **both beginners or advanced aquarists**.

The **flexible design** provides an easy to use robust system that can be tailored to suit **even the most demanding aquarist** and includes all of the essential features required for keeping a successful aquarium.

By making the tank wider than it is tall we create a more balanced aspect ratio which greatly **enhances the viewing experience**, allowing easier and more natural aquascaping and coral placement.

## Filter Sump

Our **"Dual flow"** multi chamber sump is compatible with most current reefkeeping methodologies. if you want to skim before or after the refugeum then this sump design is flexible enough to accommodate both approaches.

**9. Twin filter socks** for super fine prefiltration of the water from the tank with filter sock silencing to remove any annoying trickle.

**10. Large skimmer / equipment** section.

**11. Refugium** section for caulerpa bed or for growing coral frags.

**12. Pump chamber.**

**13. Large 17.5lt top-up reservoir.**

[www.fb.com/groups/ddreefpro](http://www.fb.com/groups/ddreefpro)

The **D-D Reef Pro** Aquariums feature our special **ULTRA-FLOW** Weir Comb.

Maintaining high flow through a standard a weir comb isn't an easy task, weir boxes are usually designed to be as small and unobtrusive as possible and are normally restricted by a standard weir comb.

The **D-D ULTRA-FLOW** removable weir comb features horizontal and vertical drain slots allowing around 30-50% more water flow compared to a standard overflow comb. The higher flow through the weir comb also allows for higher output return pumps to be employed.

We even supply a spare comb section for use during cleaning.
